personal names hitler and the holocaust a socio onomastic study of genocide and nazi germany provides readers with an increased understanding of and sensitivity to the many powerful ways in which personal names are used by both perpetrators and victims during wartime this book concentrates on one of the most terrifying and yet fascinating periods of modern history the holocaust in particular it examines the different ways in which personal names were used by nationalist socialists to hunt and destroy the victims of their genocidal ideology even before requiring jewish residents to wear a yellow star of david and have the letter j stamped on their passports nazi leaders had decreed that all jewish women and men must add the names sara h and israel to their documentation it did not take long for the perfidious logic behind this naming onomastic legislation to become frighteningly clear it made it that much easier to pinpoint jewish residents for discrimination marginalization relocation deportation and ultimately extermination through compelling first hand accounts from holocaust survivors in depth interviews with descendants of nazi war criminals and a plethora of chilling cases extracted directly from the meticulous records kept by the national socialists this work presents a harrowing historical account of the way personal names were used during the third reich to achieve hitler s

homicidal vision importantly the use of personal names and naming to target and annihilate victims is not a historical anomaly of world war ii but a widespread sociolinguistic practice that has been demonstrated in many modern day acts of genocide from rwanda to bosnia berlin to washington when governmental controls are abridged and ethical boundaries are crossed very quickly something as simple as a person s name can determine who lives and who dies

there is a growing interest in the use of ontologies for multi agent system applications on the one hand the agent paradigm is successfully employed in those applications where autonomous loosely coupled heterogeneous and distributed systems need to interoperate in order to achieve a common goal on the other hand ontologies have established themselves as a powerful tool to enable knowledge sharing and a growing number of applications have benefited from the use of ontologies as a means to achieve semantic interoperability among heterogeneous distributed systems in principle ontologies and agents are a match made in heaven that has failed to happen what makes a simple piece of software an agent is its ability to communicate in a social environment to make autonomous decisions and to be proactive on behalf of its user communication ultimately depends on understanding the goals preferences and constraints posed by the user autonomy is the ability to perform a task with little or no user intervention while proactiveness involves acting autonomously with no need for user prompting communication but also autonomy and proactiveness depend on knowledge the ability to communicate depends on understanding the syntax terms and structure and the semantics of a language ontologies provide the terms used to describe a domain and the semantics associated with them in addition ontologies are often complemented by some logical rules that constrain the meaning assigned to the terms these constraints are represented by inference rules that can be used by agents to perform the reasoning on which autonomy and proactiveness are based
