with the rapid growth of networking and high computing power the demand for large scale and complex software systems has increased dramatically many of the software systems support or supplant human control of safety critical systems such as flight control systems space shuttle control systems aircraft avionics control systems robotics

patient monitoring systems nuclear power plant control systems and so on failure of safety critical systems could result in great disasters and loss of human life therefore software used for safety critical systems should preserve high assurance properties in order to comply with high assurance properties a safety critical system often shares resources between multiple concurrently active computing agents and must meet rigid real time constraints however concurrency and timing constraints make the development of a safety critical system much more error prone and arduous the correctness of software systems nowadays depends mainly on the work of testing and debugging testing and debugging involve the process of detecting locating analyzing isolating and correcting suspected faults using the runtime information of a system however testing and debugging are not sufficient to prove the correctness of a safety critical system in contrast static analysis is supported by formalisms to specify the system precisely formal verification methods are then applied to prove the logical correctness of the system with respect to the specification formal verification gives us greater confidence that safety critical systems meet the desired assurance properties in order to avoid disastrous consequences

coal provides almost 40 of the world s electricity and despite the understandable concern with respect to the environmental impact associated with coal use forecasts from the international energy agency predict that worldwide coal use will increase by up to 2 per annum until the year 2050 faced with this increase it is clearly important that the most efficient and environmentally acceptable clean coal technologies are available this book is comprised of the proceedings of the engineering foundation conference held in june 1993 in england the objective of the conference was to present ideas on methods of predicting and reducing the effects of ash deposition in coal conversion systems highlighting the problems experienced in industry considering both utilities and industrial plants and providing a view of the technology of coal ash deposition and its impact better techniques are needed to reduce the impact of ash deposition in coal fired plants and these proceedings should form a reference document for anyone either experiencing slagging or actively engaged in trying to understand or eliminate the phenomenon
