the seventh edition of this best selling text continues to provide occupational therapy students and researchers with expert guidance on conducting research from the formulation of a research hypothesis to collecting analyzing and interpreting data now updated in line with the latest acote standards the new edition has been thoroughly revised of note is a new chapter on the capstone project and the integration of the hierarchical research pyramid to

enhance the book's usability for researchers, instructors, and students, it also features a new chapter focused on using research literature to inform clinical reasoning, highlighting the benefits of scoping reviews, systemic reviews, meta-analyses, and meta-synthesis, as well as updated tests and evaluations which can be used as outcome instruments. There are also further contemporary examples of both quantitative and qualitative research, additions to the glossary of terms and statistics, and updated references throughout, offering insightful guidance on conducting research from start to finish. This invaluable resource will be essential reading for any occupational therapy student or researcher.

Over the years, the promise of artificial intelligence has inspired many researchers, and many schemes only to have incipient hopes thwarted by its complexity. With each generation of computational engines, a new wave of enthusiasm sweeps the community as solutions to a few problems come within reach. However, intractability and undecidability continue to frustrate the unwary practitioner, while unsubstantiated methodologies offer ingenious solutions that hold more promise than potential. Despite its undulating past and variegated present, AI has made solid contributions to a growing information technology. Expert systems and allied tools have become a mainstay of industrial and business organizations. Intelligent interfaces have increased accessibility of computational resources, and robotic innovations have redefined the manufacturing industries. Meanwhile, research in evolutionary algorithms, neural networks, fuzzy reasoning, and other exciting approaches promises continued progress in surprising new directions. These proceedings record the latest results of industrial, commercial, military, and academic artificial intelligence exploration. Seventy-seven papers, divided into twenty different areas, document a significant slice of this broad and exciting field. Although dozens of themes are treated in the papers, the topical divisions of this volume comprise the software engineering, AI interface, knowledge-based systems, temporal reasoning, machine learning, robotics, intelligent databases, planning, expert systems, applications, search techniques, genetic and evolutionary methods, design, qualitative reasoning, neural networks, knowledge representation, application paradigms, fuzzy and pattern recognition, reasoning about physical systems, parallel and distributed AI, and diagnostic systems.

In the recent past, new materials, laboratory and in situ testing methods, and construction techniques have been introduced. In addition, modern computational techniques such as the finite element method enable the utilization of sophisticated constitutive models for realistic model-based predictions of the response of pavements. The 7th RILEM International Conference on Cracking of Pavements provided an international forum for the exchange of ideas, information, and knowledge amongst experts involved in computational analysis, material production, experimental characterization, design, and construction of pavements. All submitted contributions were subjected to an exhaustive refereed peer review procedure by the scientific committee, the editors, and a large group of international experts in the topic. On the basis of their recommendations, 129 contributions, which best suited the goals and the objectives of the conference, were chosen for presentation and inclusion in the proceedings. The strong message that emanates from the accepted contributions is that by accounting for the idiosyncrasies of the response of pavement engineering materials, modern sophisticated constitutive

models in combination with new experimental material characterization and construction techniques provide a powerful arsenal for understanding and designing against the mechanisms and the processes causing cracking and pavement response deterioration as such they enable the adoption of truly mechanistic design methodologies the papers represent the following topics laboratory evaluation of asphalt concrete cracking potential pavement cracking detection field investigation of pavement cracking pavement cracking modeling response crack analysis and damage prediction performance of concrete pavements and white toppings fatigue cracking and damage characterization of asphalt concrete evaluation of the effectiveness of asphalt concrete modification crack growth parameters and mechanisms evaluation quantification and modeling of asphalt healing properties reinforcement and interlayer systems for crack mitigation thermal and low temperature cracking of pavements and cracking propensity of wma and recycled asphalts

this book features up to date technology applications to radiation detection it synthesises several techniques of and approaches to radiation detection covering a wide range of applications and addressing a large audience of experts and students many of the talks are in fact reviews of particular topics often not covered in standard books and other conferences for instance the medical physics section to present these medical physics talks is crucial since a large fraction of the community in medical physics are from the particle physics community the same feature is true for astroparticle and space physics which are relatively new fields this book is unique in its scope except for iee there is no other conference in the world that presents such a wide coverage of advanced technology applied to particle physics however unlike iee more room is made in the book for reviews and general talks
