michael foote and arnold miller have stepped in to revise this classic text it is their vision to take the core approach of the second edition and reflect the substantial changes to the rudiments of the subject from the previous two decades this third edition remains an excellent text for those studying geophysical sciences

presents principles of paleontology at an undergraduate level emphasizes theory and concepts over details of morphology and the fossil record profusely illustrated with photographs charts graphs and tables

1 nekton as an ecomorphological type of biont the term nekton was suggested and used for the first time in 1890 by e haeckel in his book plankton studien etymologically the word nekton derives from the greek νηκτιν i e swimming as haeckel defined it nekton describes collectively all swimming animals that are free to choose their path i e can resist a strong current of water and distinct from planktonic animals go where they wish while giving a general idea of the dividing line between plankton and nekton haeckel s definition which has played an important role in shaping our ideas about nekton today no longer provides a sufficient basis for ecological and functional morphological investigations since it affords no possibility of quantitatively assessing either the boundary between plankton and nekton or that between nekton and other ecomorphological types of biont thus parin 1968 proceeding from haeckel s principle believes that in the epipelagic zone of the ocean the minimum size of nektonic fishes with a well developed capacity for active swimming may be between 15 and 30 cm as fishes shorter than 15 cm are unable to counter oceanic currents meanwhile young *leucaspis leucaspis delineatus* only 1.5 cm long observed by this writer in ponds near moscow proved capable of active horizontal migrations across the entire body of water which if haeckel s definition is accepted brings the border between planktonic and nektonic fish in this case to between 1.5 and 2.0 cm
