at the time of the u s japan auto conferences in march 1983 the hoped for economic recovery as manifested in auto sales had revealed itself quite modestly three months later the indicators were more robust and certainly long overdue for those whose livelihood depends on the health of the industry some of whom are university professors with japanese import restrictions in place until march 1984 and drastically reduced break even points for domestic manufactures rising consumer demand holds great promise for the industry the rapidly rising stock prices of the auto makers captures well the sense of heightened optimism as do the various forecasts for improved profits while the news is certainly welcome it nevertheless

should be greeted with caution as mr perkins noted at the conference we have a tendency to forget things very quickly if we have a boom market this year there is a good chance that a lot of things we learned will be forgotten to put the matter differently and more bluntly with growing prosperity there is the risk that management will fall back into old habits making impossible the achievement of sustained quality and productivity improvement similarly the commitment to develop cooperative relations with workers and suppliers will weaken the union will be under membership pressure to retrieve concessions rather than to take the longer term view this longer term view recognizes that up front increases and adherence to existing work rules increasingly come at the sacrifice of future job security government policymakers will turn their attention away from the industry this may not mean a great deal given how weakly focused their attentions has been during the last three years and how mixed and contradictory government auto policies have been for over a decade

component based software development regards software construction in terms of conventional engineering disciplines where the assembly of systems from readily available prefabricated parts is the norm because both component based systems themselves and the stakeholders in component based development projects are different from traditional software systems component based testing also needs to deviate from traditional software testing approaches gross first describes the specific challenges related to component based testing like the lack of internal knowledge of a component or the usage of a component in diverse contexts he argues that only built in contract testing a test organization for component based applications founded on building test artifacts directly into components can prevent catastrophic failures like the one that caused the now famous ariane 5 crash in 1996 since building testing into components has implications for component development built in contract testing is integrated with and made to complement a model driven development method here uml models are used to derive the testing architecture for an application the testing interfaces and the component testers the method also provides a process and guidelines for modeling and developing these artifacts this book is the first comprehensive treatment of the intricacies of testing component based software systems with its strong modeling background it appeals to researchers and graduate students specializing in component based software engineering professionals architecting and developing component based systems will profit from the uml based methodology and the implementation hints based on the xunit and junit frameworks
