transcendental curves in the leibnizian calculus analyzes a mathematical and philosophical conflict between classical and early modern mathematics in the late 17th century mathematics was at the brink of an identity crisis for millennia mathematical meaning and ontology had been anchored in geometrical constructions as epitomized by euclid s ruler and compass as late as 1637 descartes had placed himself squarely in this tradition when he justified his new technique of identifying curves with equations by means of certain curve tracing instruments thereby bringing together the ancient constructive tradition and modern algebraic methods in a satisfying marriage but rapid advances in the new fields of infinitesimal calculus and mathematical mechanics soon ruined his grand synthesis descartes s scheme left out transcendental curves i e curves with no polynomial equation but in the course of these subsequent developments such curves emerged as indispensable it was becoming harder and harder to juggle cutting edge mathematics and ancient conceptions of its foundations at the same time yet leading mathematicians such as leibniz felt compelled to do precisely this the new mathematics fit more naturally an analytical conception of curves than a construction based one yet no one wanted to betray the latter as this was seen as virtually tantamount to stop doing mathematics altogether the credibility and authority of mathematics depended on it brings to light this underlying and often implicit complex of concerns that permeate early calculus evaluates the technical conception and mathematical construction of the geometrical method reveals a previously unrecognized liebnizian programmatic cohesion in early calculus provides a beautifully written work of outstanding original scholarship
