as the dominant paradigm of economic activity is shifting to a focus on creating customer value it is becoming increasingly clear that companies must be able to formulate business strategies product and service strategies and internal operating strategies that accelerate the creation and delivery of customer value the ability to create value has become the primary source of sustainable competitive strength with this book ulwick introduces a strategy formulation theory and process that allows firms to create strategies that consistently produce breakthrough results the application of advanced modeling and pattern detection techniques commonly reserved for physics and the behavioral sciences is used in both the design of the theory and in the process it initiates its application can result in strategies and solutions that delivery up to ten times more value than those created with traditional methods it is a process that can be broadly applied across an organization and a wide range of subjects or missions ulwick describes outcome based logic which can transform organizational dynamics and the way an organization approaches the process of strategy formulation and proposes a universal strategy formulation model which defines the four essential elements of strategy creation desired outcomes constraints the desired competitive position and solutions using this model it becomes possible for an organization to first choose its desired competitive position and then work to uncover the strategy or solution that will enable it to occupy that position the book also introduces a process called the customer driven mission achievement process cd map now successfully used by many large companies to formulate and assess strategies at every organizational level of their organizations this book steeped in modern business theory and backed by years of practical experience will help practitioners in any company improve their operations and their competitive position

using a new systematic framework this illuminating book turns ideation into a task anybody with sound logic and a determination to learn can do and do well by separating the process from the outcome in a competitive marketplace all firms must constantly innovate to create sustained shareholder value the main roadblock in innovation is ideation the

identification of value creating ideas often seen as the work of innately creative people this first of its kind textbook demonstrates that anyone can ideate through specific logical processes that require no creativity when used but generate valuable and creative outcomes to help students master and apply these methods the book is filled with innovation examples across many sectors that can be explained and recreated using a specific lct method the book also includes exercises that enable readers to practice applying each method to solve real life innovation challenges upper level undergraduate and postgraduate students of innovation creativity and new product development will appreciate the demystification of ideation into a problem that can be solved by applying a series of rigorous defined methods that can be followed without ambiguity

this well organised book provides an in depth coverage of vlsi design engineering which ranges from cmos logic to physical design automation the book begins with a discussion on the structure and operation of mos as mosfet is the basic building block for any vlsi design then it goes on to explain the various fabrication methods of mosfet and cmos implementation and properties of mos inverter circuit and parasitic parameters and resistances associated with mosfet which determine and ultimately limit the performance of a digital system besides it describes design methodology and the concept of the combinational static logic circuits sequential circuit design and cmos dynamic circuits finally the book examines semiconductor memory and the importance of adder and multiplier circuits for the vlsi designer primarily intended as a text for the undergraduate and postgraduate students of electrical and electronics engineering the book would also be of considerable value to designers both beginners and professionals key features provides mathematical derivations for both noise margin and logic voltage explains all combinational and sequential logics separately contains a large number of solved and unsolved problems based on issues related to digital vlsi design

a presentation of current work that systematically explores and articulates the nature origin and development of reasoning this volume s primary aim is to describe and examine contemporary theory and research findings on the topic of deductive reasoning many contributors believe concepts such as structure competence and mental logic are necessary

saving truth from paradox is an ambitious investigation into paradoxes of truth and related issues with occasional forays into notions such as vagueness the nature of validity and the g $\ddot{o}$ del incompleteness theorems hartry field presents a new approach to the paradoxes and provides a systematic and detailed account of the main competing approaches part one examines tarski s kripke s and lukasiewicz s theories of truth and discusses validity and soundness and vagueness part two considers a wide range of attempts to resolve the paradoxes within classical logic in part three field turns to non classical theories of truth that that restrict excluded middle he shows that there are theories of this sort in which the conditionals obey many of the classical laws and that all the semantic paradoxes not just the simplest ones can be handled consistently with the naive theory of truth in part four these theories are extended to the property theoretic paradoxes and to various other paradoxes and some issues about the understanding of the notion of validity are addressed extended paradoxes involving the notion of determinate truth are treated very thoroughly and a number of different arguments that the theories lead to revenge problems are addressed finally part five deals with dialetheic approaches to the paradoxes approaches which instead of restricting excluded middle accept certain contradictions but alter classical logic so as to keep them confined to a relatively remote part of the language advocates of dialetheic theories have argued them to be better than theories that restrict excluded middle for instance over issues related to the incompleteness theorems and in avoiding revenge problems field argues that dialetheists claims on behalf of their theories are quite unfounded and indeed that on some of these issues all current versions of dialetheism do substantially worse than the best theories that restrict excluded middle

most systems in science engineering and biology are of partial differential systems pdss modeled by partial differential equations many books about partial differential equations have been written by mathematicians and mainly address some fundamental mathematic backgrounds and discuss some mathematic properties of partial differential equations only a few books on pdss have been written by engineers however these books have focused mainly on the theoretical stabilization analysis of pdss especially mechanical systems this book investigates both robust stabilization control design and robust filter design and reference tracking control design in mechanical signal processing and control systems to fill a gap in the study of pdss robust engineering designs of partial differential systems and their applications offers some fundamental background in the first two chapters the rest of the chapters focus on a specific design topic with a corresponding deep investigation into robust h filtering stabilization or tracking design for more complex and practical pdss under stochastic fluctuation and external disturbance this book is aimed at engineers and scientists and addresses the gap between the theoretical stabilization results of pdss in academic and practical engineering designs more focused on the robust h filtering stabilization and tracking control problems of linear and nonlinear pdss under intrinsic random fluctuation and external disturbance in industrial applications part i provides backgrounds on pdss such as galerkin s and finite difference methods to approximate pdss and a fuzzy method to approximate nonlinear pdss part ii examines robust h filter designs for the robust state estimation of linear and nonlinear stochastic pdss

and part iii treats robust h stabilization and tracking control designs of linear and nonlinear pdss every chapter focuses on an engineering design topic with both theoretical design analysis and practical design examples

these are exciting times for philosophical theorizing about propositions with the last 15 years seeing the development of new approaches and the emergence of new theorists propositions have been invoked to explain thought and cognition the nature and attribution of mental states language and communication and in philosophical treatments of truth necessity and possibility according to frege and russell and their followers propositions are structured mind and language independent abstract objects which have essential and intrinsic truth conditions some recent theorizing doubts whether propositions really exist and if they do asks how we can grasp entertain and know them but most of the doubt concerns whether the abstract approach to propositions can really explain them are propositions really structured and if so where does their structure come from how does this structure form a unity and does it need to are the representational and structural properties of propositions really independent of those of thinking and language what does it mean to say that an object occurs in or is a constituent of a proposition the volume takes up these and other questions both as they apply to the abstract object approach and also

to the more recently developed approaches while the volume as a whole does not definitively and unequivocally reject the abstract objection approach for the most part the papers explore new critical and constructive directions this book was originally published as a special issue of the canadian journal of philosophy
