print format only note no further discount for this print product overstock sale significantly reduced list price this new book from the nasa history series tackles an interesting duo of biological problems that will be familiar to anybody who has seen photos of apollo astronauts quarantined after their return to earth namely how do we avoid contaminating celestial bodies with earthly germs when we send spacecraft to study these bodies and how do we avoid spreading foreign biological matter from space when our robotic and human spacefarers return to earth biological matter from an external system could potentially cause an unchecked epidemic either on earth or in space so strict precautions are necessary each time a space vehicle visits another world it runs the risk of forever changing that extraterrestrial environment we are surrounded on earth by a mélange of different microorganisms and if some of these hitchhike onboard a space mission they could contaminate and start colonies on a different planet such an occurrence would irrevocably alter the nature of that world compromise all future scientific exploration of the body and possibly damage any extant life on it by inadvertently carrying exotic organisms

back to earth on our spacecraft we also risk the release of biohazardous materials into our own ecosystem such concerns were recognized by scientists even before the 1957 launch of sputnik this book presents the history of planetary protection by tracing the responses to the above concerns on nasa s missions to the moon mars venus jupiter saturn and many smaller bodies of our solar system the book relates the extensive efforts put forth by nasa to plan operations and prepare space vehicles that return exemplary science without contaminating the biospheres of other worlds or our own to protect irreplaceable environments nasa has committed to conducting space exploration in a manner that is protective of the bodies visited as well as of our own planet

sickened by the contamination of their water their air of the earth itself more and more people are coming to realize that it is capitalism that is quite literally killing them it is now clearer than ever that capitalism is also degrading the earth s ability to support other forms of life capitalism s imperative to make profit at all costs and expand without end is destabilizing earth s climate while increasing human misery and inequality on a planetary scale already hundreds of millions of people are facing poverty in the midst of untold wealth perpetual war growing racism and gender oppression the need to organize for social and environmental reforms has never been greater but crucial as reforms are they cannot solve our intertwined ecological and social crises creating an ecological society reveals an overwhelmingly simple truth fighting for reforms is vital but revolution is essential because it aims squarely at replacing capitalism with an ecologically sound and socially just society

creating an ecological society is filled with revolutionary hope fred magdoff and chris williams who have devoted their lives to activism marxist analysis and ecological science provide informed fascinating accounts of how a new world can be created from the ashes of the old their book shows that it is possible to envision and create a society that is genuinely democratic equitable and ecologically sustainable and possible not one moment too soon for society to change fundamentally and be brought into harmony with nature

environmental educators face a formidable challenge when they approach climate change due to the complexity of the science and of the political and cultural contexts in which people live there is a clear consensus among climate scientists that climate change is already occurring as a result of human activities but high levels of climate change awareness and growing levels of concern have not translated into meaningful action communicating climate change provides environmental educators with an understanding of how their audiences engage with climate change information as well as with concrete empirically tested communication tools they can use to enhance their climate change program starting with the basics of climate science and climate change public opinion armstrong krasny and schuldt synthesize research from environmental psychology and climate change communication weaving in examples of environmental education applications throughout this practical book each chapter covers a separate topic from how environmental psychology explains the complex ways in which people interact with climate change information to communication strategies with a focus on framing metaphors and messengers this broad set of topics will aid educators in formulating program language for their classrooms at all levels communicating climate change uses fictional vignettes of climate change education programs and true stories from climate change educators working in the field to illustrate the possibilities of applying research to practice armstrong et all ably demonstrate that environmental education is an important player in fostering positive climate change dialogue and subsequent climate change action thanks to generous funding from cornell university the ebook editions of this book are available as open access from cornell open cornellpress cornell edu cornell open and other open access repositories
