this proceedings volume presents the talks from the fifth annual meeting on dna based computers held at mit the conference brought together researchers and theorists from many disciplines who shared research results in biomolecular computation two styles of dna computing were explored at the conference 1 dna computing based on combinatorial search where randomly created dna strands are used to encode potential solutions to a problem and constraints induced by the problem are used to identify dna strands that are solution witnesses and 2 dna computing based on finite state machines where the state of a computation is encoded in dna which controls the biochemical steps that advance the dna based machine from state to state featured articles include discussions on the formula satisfiability problem self assembly and nanomachines simulation and design of molecular systems and new theoretical approaches

daily life relies more and more on safety critical systems e.g. in areas such as power plant control, traffic management, flight control and many more. Movep is a school devoted to the broad subject of modeling and verifying software and hardware systems. This volume contains tutorials and annotated bibliographies covering the main subjects addressed at Movep 2000. The four tutorials deal with model checking, theorem proving, composition and abstraction techniques and timed systems. Three research papers give detailed views of high level message sequence charts, industrial applications of model checking and the use of formal methods in security. Finally, four annotated bibliographies give an overview of infinite state space systems, testing, transition systems, fault model driven test derivation and mobile processes.

Both the way we look at data through a DBMS and the nature of data we ask a DBMS to manage have drastically evolved over the last decade, moving from text to images and to sound. To a lesser extent, visual representations are used extensively within new user interfaces. Powerful visual approaches are being experimented for data manipulation, including the investigation of three-dimensional display techniques. Similarly, sophisticated data visualization techniques are dramatically improving the understanding of the information extracted from a database. On the other hand, more and more applications use images as basic data or to enhance the quality and richness of data manipulation services. Image management has opened a wide area of new research topics in image understanding and analysis. The IFIP 2.6 working group on databases strongly believes that a significant mutual enrichment is possible by confronting ideas, concepts and techniques supporting the work of researchers and practitioners in the two areas of visual interfaces to DBMS and DBMS management of visual data. For this reason, IFIP 2.6 has launched a series of conferences on visual database systems. The first one has been held in Tokyo 1989, VDB 2 was held in Budapest 1991. This conference is the third in the series. As the preceding editions, the conference addresses researchers and practitioners active or interested in user interfaces, human computer communication, knowledge representation and management, image processing and understanding, multimedia, database techniques and computer vision.
