radiation induced soft errors are a major concern for modern digital circuits especially memory elements unlike large random access memories that can be protected using error correcting codes and bit interleaving soft error protection of sequential elements i e latches and flip flops is challenging traditional techniques for designing soft error resilient sequential elements generally address single node errors or single event upsets seus however with technology scaling the charge deposited by a single particle strike can be simultaneously collected and shared by multiple circuit nodes resulting in single event multiple upsets semus in this work we target semus by presenting a design framework for soft error resilient sequential cell design with an overview of existing circuit and layout techniques for soft error mitigation and introducing a new soft error resilience layout design principle called leap or layout design

through error aware transistor positioning we then discuss our application of leap to the seu immune dual interlocked storage cell dice by implementing a new sequential element layout called leap dice retaining the original dice circuit topology we compare the soft error performance of seu immune flip flops with the leap dice flip flop using a test chip in 180nm cmos under 200 mev proton radiation and conclude that 1 our leap dice flip flop encounters on average 2 000x and 5x fewer errors compared to a conventional d flip flop and our reference dice flip flop respectively 2 our leap dice flip flop has the best soft error performance among all existing seu immune flip flops 3 in the evaluation of our design framework we also discovered new soft error effects related to operating conditions such as voltage scaling clock frequency setting and radiation dose
