provides public health sanitary and water engineers baseline data for designing plants for the treatment of industrial effluents rich in the metallic species in general and that of nickel and chromium in particular. Water pollution is a topic of immense and common concern throughout the world with a rapidly escalating global population and increased industrial development in a growing number of countries the world's freshwater resources have become stressed. One way to get more out of less is treatment and reuse. Nickel and chromium are toxic metals and they are used extensively in numerous industries such as textiles, beverages, steel, pulp and paper and electroplating. Their industrial effluent contains large measures of non biodegradable traces that are harmful to flora, fauna and human beings. Although there are a number of methodologies used for treatment of metal containing industrial effluents and waste water, there is not one up to now that offers a high capacity removal rate at an economical cost. This book presents the results and data from research and adsorption experiments carried out on the removal of nickel and chromium as well as other metals from aqueous solutions using modified silica sand. The data resulting from detailed kinetic equilibrium and thermodynamic studies show that the removal capacity is increased so the treated water has a higher quality or purity. It also demonstrates that the extraction of metals is achieved at a significant lower cost because the treated water adsorption is a simple process with less maintenance and because silica is a nontoxic natural material widely available in all parts of the world.

This book contains the most important formulas and more than 190 completely solved problems from kinetics and hydrodynamics. It provides engineering students material to improve their skills and helps to gain experience in solving engineering problems. Particular emphasis is placed on finding the solution path and formulating the basic equations. Topics include kinematics of a point, kinetics of a point mass, dynamics of a system of point masses, kinematics of rigid bodies, kinetics of rigid bodies, impact, vibrations, non inertial reference frames, hydrodynamics.
